

Tips and comments for the foundation plan or rather installation of hydraulic flash-mounted single piston lifts with grating

General instructions for the installation:

The right placement for the single piston lift depends according to the use for

- car service and repair
- body repair and laque
- car wash

on the instructions of the car manufacturers and of the client for whom it is built. Please note the requirements of the building.

Location of the control desk at the wall:

The best position is in driving direction in front left. Lay the idle pipe DN 48 mm from the Installation cassette with a round exit to the control desk.

Important: Carry out no small radius when installing the idle pipe but streched curves.

II. Laving the foundations:

The installation cassette for the lifting platform is guite an element resistant to deflection for receiving the forces from the lifting cylinder of the lifting platform and it is at the same time a "lost formwork".

Installation cassette without piston: Weights:

about 150 kg

Installation cassette with piston:

about 350 kg

a) Size of the foundation bottom with solid and binding soil

Lenght and width: cassette dimensions plus at least 150 mm circulating

Thickness: approx. 180-200 mm

C 12/15 non-reinforced (look at section A-A and B-B) Quality of concrete:

b) Size of the excavation with solid and binding soil

At the bottom: Below: analogous foundation bottom

At the top: Lenght and width of the installation cassette plus and additional at least

300 mm on the left and right side circulating (look at section A-A and B-B).

ATTENTION: Please ask an expert for construction if the soil is not solid binding or if ground water appears.

Works have to be done during the construction

Connect a flexible idle-pipe DN 48 mm cleaned and sealed at the prepared exit at theinstallation cassette and lay it up to the control desk.

Use of the auxiliary profiles: zero level auxiliary profilecirculating sheet metal _U-profile cover plate 200x75 cassette

III. Inserting, adjusting and encasing in concrete of the installation cassette

a) Inserting:

The installation cassette is to be inserted exactly to the axles of the plan view.

b) Adjusting:

The circulating vertical plate (h=25 mm) at the circulating U-shaped-iron (100 x 50 x 6 mm) is the supporting surface for a long spirit level (see detail C); top edge of the vertical plate = top edge of the finished ground = ± 0.00 .

The adjusting of the installation cassette takes place in the three directions length, width and depth and has to be carried out very carefully!

The measure of the altitude (depth) is -15mm up to max. -12mm. The reference measure point is the top edge of the finished ground. The later rectifying of an installation cassette witch is not aligned causes enormous costs.

IMPORTANT: Use a long spirit level absolutely!

Supports for installation: The supports for installation are two U-shaped-irons 100 x 50 x 6 mm with a lenght of approx. 1,50 m. They have to be screwed on at the right and left side of the installation cassette (see plan, detail F). The supports for installation can be borrowed for a rental charge at the manufacturer.

c) Incasing in concrete:

- 1. Foundation bottom (see also point II b)
- 2. When the installation cassette is inserted perpendicular and aligned, fill in stamped concrete C 12/15 in regular layers and compress it (stamped concrete up to under the edge of the reinforced increte slab.

ATTENTION: The position of the installation cassette is to be checked continually during the incasing in concrete.

- 3. The reinforced concrete bottom is to be carried out at the end of the encasing in concrete in C 20/25. The U-shaped-iron 100 x 50 mm has to be encased in concrete at least two third of its height into the reinforced concrete slab.
- Poor ground conditions (not binding soil), this means large excavacation:

The incasing of concrete has to be done in three steps:

1st step: Fill in up to 20 cm / 8 inch

2ndstep: Fill in up to the half of the cassettes high

3rd step: Fill in up to the level of the reinforced concrete layer

5. Ground water

For the protection against buoyancy ask an expert for construction. At least strenghten and reinforce the floor. Reinforce the walls, concrete at least in C 20/25.

6. Working places in series

Arrange the lifting platforms all in one axle.

IV. Technical instructions:

a) Electrical connections

Supply of the control desk: 5 x 2,5mm², 400 V, 50 Hz, 16 A inert.

According to the local regulations an sufficient precautionary measure for the installation cassette is to plan.

Attention / Important tips:

Please ask the manufacturer or the regional service partner for other detailed questions.

Fixing the finished ground / tiled floor:

Water should not accumulate near the lifting platform/installation cassette and no "water pools" should emerge. Please lay the incline and the tolerance in altitude flowing the water always away from the lifting platform/installation cassette.

What is to do after the carrying out of the installation of the lifting platform or the operational handing over:

The lifting platform, especially the exits of the pistons, the cover plate of the installation cassette and the installed load receivers have to be protected against dirtying. Especially quartz sand, mortar and cleaners for tiles are to keep away.
